

Quantum Mechanics I HW1

Diego Ramírez Milano (201214691)

Febrero 7 de 2016

Given the the wave function

$$\Psi(x, t) = e^{-iEt/\hbar} N e^{-x^2/2\lambda^2} \quad (1)$$

$$\Psi^*(x, t) = e^{iEt/\hbar} N e^{-x^2/2\lambda^2} \quad (2)$$

Where N is the normalization factor and $\lambda = \sqrt{\frac{\hbar}{m\omega}}$.
The Hamiltonian operator for the harmonic oscillator reads

$$\hat{H} = -\frac{\hbar^2}{2m} \frac{d^2}{dx^2} + \frac{1}{2} k x^2 = -\frac{\hbar^2}{2m} \frac{d^2}{dx^2} + \frac{1}{2} m \omega^2 x^2 \quad (3)$$

Help

$$\int_0^\infty e^{-a^2 x^2} dx = \frac{\sqrt{\pi}}{2a}, \quad a > 0 \quad (4)$$

$$\int_0^\infty x^2 e^{-a^2 x^2} dx = \frac{\sqrt{\pi}}{4a^3}, \quad a > 0 \quad (5)$$

$$\int_{\mathbb{R}} \Psi \Psi^* dx = 1 \quad (6)$$

1. Find the normalization factor N .

$$\int_{\mathbb{R}} \Psi \Psi^* dx = \int_{\mathbb{R}} e^{-iEt/\hbar} N e^{-x^2/2\lambda^2} e^{iEt/\hbar} N e^{-x^2/2\lambda^2} dx = \int_{\mathbb{R}} N^2 e^{-x^2/\lambda^2} dx \quad (7)$$

Now we use the substitution

$$\begin{aligned} u &= \frac{x}{\lambda} \\ \lambda du &= dx \end{aligned} \quad (8)$$

$$\begin{aligned} \lambda N^2 \int_{\mathbb{R}} e^{-u^2} du &= 1 \\ \lambda N^2 \sqrt{\pi} &= 1 \end{aligned} \quad (9)$$

$$\boxed{N = \frac{1}{\sqrt{\lambda \sqrt{\pi}}} = \sqrt[4]{\frac{m\omega}{\hbar \pi}}}$$

2. Calculate the probability for the particle to be in the interval $[0, \infty]$

$$\int_0^\infty \Psi \Psi^* dx = N^2 \int_0^\infty e^{-x^2/\lambda^2} dx \quad (10)$$

Using same substitution as (??) we get

$$\lambda N^2 \int_0^\infty e^{-u^2} dx = N^2 \lambda \frac{\sqrt{\pi}}{2} \quad (11)$$

$$\boxed{P = \frac{\lambda}{\lambda\sqrt{\pi}} \frac{\sqrt{\pi}}{2} = \frac{1}{2}}$$

3. Calculate the values $\langle x \rangle$, $\langle x^2 \rangle$, $\langle \hat{P}_x \rangle$ and $\langle \hat{P}_x^2 \rangle$.

For $\langle x \rangle$:

$$\langle x \rangle = \int_{\mathbb{R}} x \Psi \Psi^* dx = N^2 \int_{\mathbb{R}} x e^{-x^2/\lambda^2} dx \quad (12)$$

Now we use the substitution

$$u = \frac{x^2}{\lambda^2} \quad (13)$$

$$du = \frac{2x}{\lambda^2} dx$$

$$\begin{aligned} &= N^2 \frac{\lambda^2}{2} \int_{\mathbb{R}} e^{-u} du = -N^2 \frac{\lambda^2}{2} (e^{-u}) \\ &= -\frac{\lambda}{2\sqrt{\pi}} e^{-x^2/\lambda^2} \Big|_{-\infty}^{\infty} \\ &= \boxed{-\frac{\lambda}{2\sqrt{\pi}} (0 - 0) = 0} \end{aligned} \quad (14)$$

For $\langle x^2 \rangle$:

$$\langle x^2 \rangle = \int_{\mathbb{R}} x^2 \Psi \Psi^* dx = N^2 \int_{\mathbb{R}} x^2 e^{-x^2/\lambda^2} dx \quad (15)$$

We take advantage now of help number 2 in equation (??) to say:

$$N^2 \int_{\mathbb{R}} x^2 e^{-x^2/\lambda^2} dx = N^2 \frac{\sqrt{\pi} \lambda^3}{2} \quad (16)$$

$$\boxed{\langle x^2 \rangle = \frac{\lambda^2}{2} = \frac{\hbar}{2m\omega}}$$

For $\langle \hat{P}_x \rangle$:

$$\begin{aligned}
\langle \hat{P}_x \rangle &= N^2 \int_{\mathbb{R}} e^{-x^2/2\lambda^2} \left(-i\hbar \frac{d}{dx} e^{-x^2/2\lambda^2} \right) dx \\
&= \frac{N^2 i\hbar}{\lambda^2} \int_{\mathbb{R}} x e^{-x^2/2\lambda^2} dx \\
&= \boxed{\frac{N^2 i\hbar}{\lambda^2} \langle x \rangle = 0}
\end{aligned} \tag{17}$$

For $\langle \hat{P}_x^2 \rangle$:

$$\langle \hat{P}_x^2 \rangle = - \int_{\mathbb{R}} \hbar^2 \frac{d^2}{dx^2} \Psi \Psi^* dx = -N^2 \hbar^2 \int_{\mathbb{R}} e^{-x^2/2\lambda^2} \frac{d^2}{dx^2} e^{-x^2/2\lambda^2} dx \tag{18}$$

In a separate place we compute the derivatives

$$\begin{aligned}
\frac{d}{dx} e^{-x^2/2\lambda^2} &= -\frac{x}{\lambda} e^{-x^2/2\lambda^2} \\
\frac{d^2}{dx^2} e^{-x^2/2\lambda^2} &= \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) e^{-x^2/2\lambda^2}
\end{aligned} \tag{19}$$

Therefore using what we just computed we get:

$$\begin{aligned}
\langle \hat{P}_x^2 \rangle &= -N^2 \hbar^2 \int_{\mathbb{R}} e^{-x^2/2\lambda^2} \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) e^{-x^2/2\lambda^2} dx \\
&= -\frac{\hbar^2}{\lambda^4} \left(\int_{\mathbb{R}} N^2 x^2 e^{-x^2/2\lambda^2} dx - \int_{\mathbb{R}} N^2 \lambda^2 e^{-x^2/2\lambda^2} dx \right) \\
&= -\frac{\hbar^2}{\lambda^4} \left(\langle x^2 \rangle - \lambda^2 \right) = -\frac{\hbar^2}{\lambda^4} \left(\frac{\lambda^2}{2} - \lambda^2 \right) \\
&= \boxed{\frac{\hbar^2}{2\lambda^2} = \frac{m\omega}{2}}
\end{aligned} \tag{20}$$

4. Find the eigenvalue E in $\hat{H}\Psi = E\Psi$

We now implement what is stated in equation (??) to the wave function, so we get

$$\begin{aligned}
\hat{H}\Psi &= -\frac{\hbar^2}{2m} \frac{d^2}{dx^2} \Psi + \frac{1}{2} m\omega^2 x^2 \Psi \\
&= -\frac{\hbar^2}{2m} e^{-iEt/\hbar} N e^{-x^2/2\lambda^2} \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) + \frac{1}{2} m\omega^2 x^2 e^{-iEt/\hbar} N e^{-x^2/2\lambda^2} \\
&= -\frac{\hbar^2}{2m} \Psi \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) + \frac{1}{2} m\omega^2 x^2 \Psi \\
&= \Psi \left(-\frac{\hbar^2}{2m} \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) + \frac{1}{2} m\omega^2 x^2 \right)
\end{aligned} \tag{21}$$

From here we can now solve for E :

$$\begin{aligned}
 E\Psi &= \Psi \left(-\frac{\hbar^2}{2m} \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) + \frac{1}{2}m\omega^2 x^2 \right) \\
 E &= \boxed{-\frac{\hbar^2}{2m} \left(\frac{x^2 - \lambda^2}{\lambda^4} \right) + \frac{1}{2}m\omega^2 x^2}
 \end{aligned} \tag{22}$$

Finally replacing λ in equation (??) we can simplify the expression to

$$\begin{aligned}
 E &= -\frac{\hbar^2 m^2 \omega^2 x^2}{2m\hbar^2} + \frac{\hbar^2 m\omega}{2m\hbar} + \frac{1}{2}m\omega^2 x^2 \\
 &= -\frac{1}{2}m\omega^2 x^2 + \frac{\hbar\omega}{2} + \frac{1}{2}m\omega^2 x^2 = \boxed{\frac{\hbar\omega}{2}}
 \end{aligned} \tag{23}$$

5. Calculate the probability current j_x

$$\begin{aligned}
 j_x &= \frac{i\hbar}{2m} \left(\Psi \frac{d}{dx} \Psi^* - \Psi^* \frac{d}{dx} \Psi \right) \\
 &= \frac{i\hbar}{2m} \left(N^2 e^{-x^2/2\lambda^2} \frac{d}{dx} e^{-x^2/2\lambda^2} - N^2 e^{-x^2/2\lambda^2} \frac{d}{dx} e^{-x^2/2\lambda^2} \right) \\
 &= \frac{i\hbar N^2}{2m} e^{-x^2/2\lambda^2} \left(\frac{d}{dx} e^{-x^2/2\lambda^2} - \frac{d}{dx} e^{-x^2/2\lambda^2} \right) \\
 &= \boxed{0}
 \end{aligned} \tag{24}$$
